1.12.4 Release Notes

Changes

General

[EF-2100] No error message when attempting to register patient who doesn't have an address on PDS

Very occasionally, it is possible to find a patient on the NHS Spine whose registration record exists without an address. This has previously caused difficulties during the creation of a local patient record within the eVacc application.

Functionality has now been introduced that allows the user to supplement the local record with the details of the patient's address.

Any additional demographic information that is entered is not synchronised with the NHS Patient Demographic Service (PDS), but is included in downstream data extracts (such as that to the Data Processing Service).

Clicking the 'Edit Fields' button allows the user to now enter additional address and postcode information. Once completed the patient can be created.

Patient Registration

NHS Number
944-930-7865

Family Name
BOST

First Name
POLLIE

Date of Birth   DD-MM-YYYY
20-10-1985

Gender
Female

Address

Address is required to create the patient

Postcode

Postcode is required to create the patient

ⓘ A patient has been found on PDS with the details above. If this is the correct patient, you can edit the fields.

If this is not the right patient, you can clear and perform a new search with different data.

[EF-2388] Trailing comma in care home manual address entry breaks schema

If the address lines are manually entered with a trailing comma in the COVID vaccinations pre-assessment care home address form, a schema error was triggered when saving the form.

this is an address,

Address cannot contain empty lines. Please remove any trailing commas
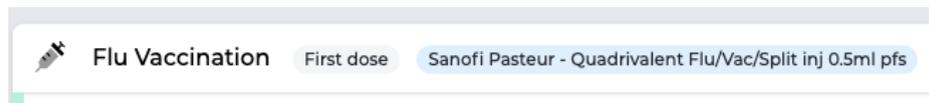

Town

This is a town

Postcode

PL311EX

As we can see from this image, a warning message is now displayed if any trailing commas are detected within the address line.

[EF-2359] Encounter badges are not specific enough for vaccines

Vaccination badges have been updated within the journal view. The journal view now incorporates the manufacturer and vaccine (in short form) within the badge. This has been amended as some suppliers offer multiple vaccines.

Flu Vaccination   First dose   Sanofi Pasteur - Quadrivalent Flu/Vac/Split inj 0.5ml pfs

[EF-1312] Frontend professional registration validations

When entering a healthcare professionals registration value, if it contained a mix of upper and lower case letters an error would be returned. The field has now been given additional validation to help highlight these inaccuracies before attempting to save the entered detail.

[EF-2297] Improve journal backend validation checks

Opening the same patient record for the purposes of adding/editing templates across multiple browser windows has led to a very small number of issues being experienced. Improvements have been made to check for the following conditions:
- Check for presence of additional information before allowing creation of pre-assessment (covid only)
- Check for lack of existence of pre-assessment when deleting additional info (covid only)
- Check for lack of existence of vacc when deleting pre-assessment (covid and flu)
- Check for lack of existence of adverse reaction when deleting vacc

[EF-2307] Templates shouldn't allow multiple submissions

It has been observed that it was possible to click the 'Save' button multiple times in quick succession. The first click would then result in a successful submission of the form, whilst subsequent requests would fail. Functionality has now been implemented to only allow a single click of the button.
