2.2.1 Release Notes - Marazion

Overview

Eva Health is continuing its journey ensuring that we keep pace with the latest technologies. Within the previous release we started the migration from one searching mechanism to another when searching for patients. This release is the final step of this process allowing us to decommission the historic searching service whilst ensuring there is no impact to the user base.

In addition further enhancements have been made to logic utilised within the Reporting module tables, PDS error handling and some textual changes have been applied to the user creation and password reset emails.

Reporting

[EF-3095] Incorrect row counts in Vaccinations Incentive Payment Report

A minor issue was reported where the "TOTAL" count within the Incentive Payment report was incorrect. The "TOTAL" count was not including any of the counts of Immunosuppressed patients in the individual row counts (i.e. First Dose, Second Dose, Booster).

User Management

[EF-2961] Edit text in password reset email so that it reflects all users (both eVac and eView) logging in through one portal (Elevate)

Currently, both eVac and eView customers receive the same password reset email. The current email does not reflect the support tools for eView. Therefore an update to the email text has been made which will direct customers to the best place for them to get support.

PDS Error Handling

[EF-2288] Do not produce generic "500" errors for PDS response issues

In the very rare circumstance when the NHS Patient Demographic Service (PDS) returns an error condition from a PDS Search request, eVacc is required to handle such errors in a correct and proper manner. Error handling within the eVacc application has been improved to support such behaviour and log the error conditions accordingly. (*Note - the error logs are only visible to Eva Health support technicians, and this change has no direct effect upon the user experience*)
